AB	Disclosed are an organic electroluminescent element comprising a light emission layer containing a phosphorescent compound and a hole transporting layer adjacent thereto containing a hole transporting material, wherein the hole transporting material has a 0-0 band of the phosphorescence spectra of from 300 to 450 nm and has a mol. weight of not less than 550, and an illuminator and a display each comprising the organic electroluminescent element.

TSCA INFORMATION NOW CURRENT THROUGH December 2, 2006

Please note that search-term pricing does apply when
conducting SmartSELECT searches.

REGISTRY includes numerically searchable data for experimental and
predicted properties as well as tags indicating availability of
experimental property data in the original document. For information
on property searching in REGISTRY, refer to:

ABSTRACT:

The element, useful for blue-emitting LEDs, comprises (A) an anode, (B) a layer containing 1st hole transporters (e.g. arylamines), (C) a layer containing 2nd hole transporters, and (D) a luminescent layer containing host compds. and phosphorescent dopants, wherein the min. triplet excitation energy of the 1st hole transporters (T1a), the 2nd hole transporters (T1b), the host compds. (T1c), and the dopants (T1d) satisfy the relationships of $T1b > T1c$, $T1a < T1c$, and $T1c > T1d$. The maximum luminescence wavelength may be 380 to 500 nm. Ionization potentials of the hole transporters, the dopants, and the host compds. are also specified.

ABSTRACT:

An organic electroluminescence element is disclosed which comprises a hole transporting layer containing a hole transporting material, a light emission layer containing a host compound and a phosphorescent compound, a hole blocking layer, and an "

electron transporting layer, the host compound having a band gap of 3.3-5 eV, and having a mol. weight of ≥ 500 , and relation $c < d$ being satisfied, wherein c (eV) represents a difference between energy level of LUMO in the hole blocking layer and energy level of LUMO in the light emission layer and d (eV) represents a difference between energy level of HOMO in the hole blocking layer and energy level of HOMO in the light emission layer.

ABSTRACT:

Disclosed are an organic electroluminescent element comprising a light emission layer containing a phosphorescent compound and a hole transporting layer adjacent thereto containing a hole transporting material, wherein the hole transporting material has a 0-0 band of the phosphorescence spectra of from 300 to 450 nm and has a mol. weight of not less than 550, and an illuminator and a display each comprising the organic electroluminescent element.

ABSTRACT:

The element, useful for blue-emitting LEDs, comprises (A) an anode, (B) a layer containing 1st hole transporters (e.g. arylamines), (C) a layer containing 2nd hole transporters, and (D) a luminescent layer containing host compds. and phosphorescent dopants, wherein the min. triplet excitation energy of the 1st hole transporters (T1a), the 2nd hole transporters (T1b), the host compds. (T1c), and the dopants (T1d) satisfy the relationships of T1b > T1c, T1a < T1c, and T1c > T1d. The maximum luminescence wavelength may be 380 to 500 nm. Ionization potentials of the hole transporters, the dopants, and the host compds. are also specified.

ABSTRACT:

An organic electroluminescence element is disclosed which comprises a hole transporting layer containing a hole transporting material, a light emission layer containing a host compound and a phosphorescent compound, a hole blocking layer, and an electron transporting layer, the host compound having a band gap of 3.3-5 eV, and having a mol. weight of ≥ 500 , and relation $c < d$ being satisfied, wherein c (eV) represents a difference between energy level of LUMO in the hole blocking layer and energy level of LUMO in the light emission layer and d (eV) represents a difference between energy level of HOMO in the hole blocking layer and energy level of HOMO in the light emission layer.
